Final Project Progress Report #2

We currently have several html/php pages that use javascript and phps to connect to our mysql database in xampp. We have a home page that users go to first to log in and they can check the 'remember me' box which will remember that their account is the one logged in. We also have an option for the user to log in as a guest to visit our site where they will be able to browse but not post. There is a registration page for users who want to register. We add them to our database and then they are able to log in. Using cookies, we are able to keep track of the user's account of who is logged in and change the website based on who it is. We also have all the pages for the menu created, and you can now create new threads/topics, and post messages to existing threads if you are signed in and if you are a guest then you can only view and read the threads and messages.
